# 27 / 27

## known indicator checks recovered

Across six Singapore, Australia, and Malaysia runs against the Round 1 reference set.

**\$0.43 recorded Singapore P7 model cost**  
Source → provision → RDII output

# Two zones turn scattered laws into auditable evidence

The architecture separates evidence discovery from legal mapping and output validation.

# Four design choices make the engine reusable

Each differentiator addresses a scoring, reliability, cost, or scalability constraint.

## NEW provision detection

Independent discoveries are separated from Round 1 examples.

## Eight provider tiers

Cloud and local choices; one provider pinned for each run.

## Measured cost reporting

Token, OCR, latency, and total run cost are logged.

## YAML economy configs

Singapore, Australia, and Malaysia share one pipeline.

# One official Act, two traceable RDTII results

Selected PDPA provisions demonstrate exact-source NEW and KNOWN results from the completed run.

## What the numbers mean

27/27 measures known-indicator coverage - not universal legal accuracy. NEW results are candidates for policy review, with source text, confidence, and notes kept visible.

THE NEXT FRONTIER

# What if a trader could ask: 'Can I ship this from A to B?'

The same evidence engine can grow into a trade-intelligence layer.

One engine → broader coverage → actionable trade guidance

Built on official sources.

## THE TAKEAWAY

# We automate evidence preparation, not legal judgment.

Official source → exact provision → RDTII indicator → reviewer-ready output

### FASTER

Less manual discovery

### AUDITABLE

Evidence stays visible

### SCALABLE

More economies via config

**27/27 known checks · \$0.43 recorded run cost**
